AUTHOR: Fedorova, V. G., Smy*slava, R. A.

TITLE: Sealing agents based on liquid Thiokol

SO RCE: Kauchuk i rezina, no. 8, 1964, 28-32

TOPIC TAGS: sealing agent, Thiokol, rubber mechanical property, vulcanization, filler, epoxide resin, lithopone, polysulfide rubber, hermetic sealer, diphenylguanidine

ABSTRACT: The properties (viscosity, color, density, tensile strength, elongation, brittleness, temperature stability, adhesion and dielectric properties) of a large number of hermetic sealers based on liquid Thiokol (U-30, U-30 m, U-30s, UT-31, UT-32, UT-34, UT-35, etc.) were investigated, tabulated and compared. Experiments showed that the rate of vulcanization of liquid Thiokol is influenced by the molecular weight of the starting polymer, temperature, humidity, and the type, activity and amount of vulcanizing agent and accelerator. By adding fillers such as carbon black, epoxide resin or lithopone to the mixture, the tensile strength can be increased from 8-10 to 20-45 kg/cm² and the peeling resistance (from metal) from 0.4-1.0 to 1.5-4.5 kg/cm². The compositions of a variety of sealers based on liquid Thiokol and containing diphenylguanidine as a catalyst

Card 1/2

ACCESSION NR: AP4043972

are given. In a temperature range of 15-30C, complete vulcanization ends in 7-10 days and gives very good physico-mechanical characteristics, which remain unchanged during further vulcanization, as well as good stability in aggressive media. The conversion of pastes to a resinous material is complete in about 1-2 days, when the sealing strength is 8-15 kg/cm². For accelerated vulcanization, heating for 24-35 hours at 50C, 16-24 hrs. at 70C and 12-16 hrs. at 80C is needed. A decrease in temperature decreases the rate of vulcanization. At -40C, vulcanization stops completely. Solvents and coloring agents (10 parts by weight) do not affect the physico-mechanical properties. The variation in the physico-mechanical properties of sealers during catalytic thermal aging is shown by tabulated data. Thiokolbased sealing agents resist sea and fresh water, solvents, acids and alkalies at low concentrations, light and heat aging, and can be used successfully in many applications for insulation against air and humidity. Orig. art. has: 3 tables.

Smyjewski K., Jarosz J., Szymański L. The Influence of the Moisture Content in Raw Peat on Properties of Peat Insulating Plates.

„Wpływ wilgotności surowca torfowego na własności izolacyjnych: torfowych”. (Prace Inst. Torf. No. 4), Elbląg, 1952, Inst. Torf., 22.5 pp., 3 figs., 13 tabs.

Tests carried out on a semi-technical scale proved that in the processing of raw peat the use of hollanders and the heating of the peat pulp cannot be recommended. Rough insulating peat plates made from previously dried peat, contain 3.3 to 5.0 kg less water than plates made from raw peat. The finished plates are, although lighter, less strong. The most suitable material for this purpose is peat dried to a moisture content of 60—55%. Chemicals usually added have no actual influence on the dehydration of peat pulp.

66. DIFFUSION OF METHANE AND CARBON DIOXIDE IN MINE AIR. Šnabl, J.
(Práce Ust. Vyzk. Využ. Paliv (Commun. Fuel Res. Util. Inst., Prague),
Ser. A, 1957, vol. 8, 3-34). Experiments are recorded on the diffusion
of methane and carbon dioxide into vertical steel cylinders of air at
atmospheric pressure. The two gases were added continuously over a period
or in a single dose. Samples were taken at stated time intervals and
heights to test the course of diffusion. A subsequent test of several
weeks proved that the gases do not separate out from mixtures on account
of varying densities. Diffusion tests were also made in a horizontal
gallery at a reduced scale. Methane and carbon dioxide were introduced
at the roof, floor and walls, and samples were taken at stated times and
distances. The results are being applied in mine ventilation. For
instance, it has been found advantageous to disturb the laminar flow of
gases along the roof or floor with obstacles, and so to ensure rapid mixing
and removal of gases. (L).

A total of 80 patients (70 with peripheral arteriosclerosis and 10 with Winiwar-
Buerger's disease) were treated in 6 different ways. Two ways of pretended treat-
ment (placebo) were used as controls. The groups for treatment were chosen by
random selection. Half the patients received hospital care, the second half am-
bulatory treatment. No treatment given to ambulatory patients had any value. Hos-
pitalized patients receiving intra-arterial applications of 'dibenamine' and 'prisco'
were benefited.

"Analysis of Painful Conditions in the Anterior Chest Wall After
Myocardial Infarction"

Prague, Casopis Lekaru Ceskych, Vol CII, No 37, 13 September 63,
pp 1015-1021.

Abstract [Authors' English summary, modified]: The differential
diagnosis of pain in the anterior chest wall after a myocardial
infarction is difficult. A genuine stenocardia with all symptoms
and positive reaction to a fluid nitroglycerin within two minutes
occurs only seldom. Atypical pain with a negative reaction is
more frequent and is caused by a muscular and connective tissue
insufficiency of the proximal back and decompensated regressive
changes of the cervical and upper thoracic spine. Fifty-six re-
ferences, including 4 Czech.

Title: Growing of Yeast on Vinsasse of Acetone-Butanol Fermentation

Original
Publication: Przem. rolny i spozywczy, 1954, 8, No 5, 181

Abstract: In order to detoxify and utilize vinsasse from acetone-butanol fermentation it is proposed to use it as the nutrient medium for growing yeast (Y). The Y thus obtained is similar to baker's yeast but of a somewhat darker color; dry residue content of the Y is of 24%.

Card 1/1

Title : Formation of Yeasts in Wastes of Acetone-Butyl Fermentation.

Orig Pub: Acta microbiol. polon., 1957, 6, No 1, 87-98.

Abstract: Wastes of acetone-butyl plants, rich in nitrogen and phosphorus salts, were used for cultivation of 4 strains of yeasts from Torulopsis and Candida strains and a strain of Oospora lactis. After neutralization and establishing a pH of 5.5, the liquid was decanted and infected with yeasts. In a Klyuyver apparatus, an average yield of 3-4 g of dry yeasts per 1 liter of wastes was obtained.

TITLE: Inter-Departmental "KIPIA" Shops Must Be Organized
(Sozdat' mezhdudomstvennyye tsekhi KIPIA)

PERIODICAL: Izmeritel'naya tekhnika, 1958, Nr 1, p 90 (USSR)

ABSTRACT: "KIPIA" shops exist at most plants in the country. Their functions are the operation, maintenance and departmental supervision of instruments. Such shops are, as a rule, small and inadequately equipped, and the repair work done in a "KIPIA" shop frequently costs more than a new instrument. The author thinks that well equipped shops of such kind could well serve several plants of one type, and apply advanced work methods. This would greatly cut the costs and reduce personnel.

Still Another Means of Saving Metal

PERIODICAL:

Izmeritel'naya tekhnika, 1959, Nr 7, p 60 (USSR)

ABSTRACT:

Micrometers produced by the Soviet plants "Kalibr" and "Krasnyy instrumental'shchik" are too heavy. For example, one micrometer type produced by the plant "Kalibr" weighs 147 g more than comparable Swedish or Japanese instruments. Since the measuring range (0-25 mm), the accuracy class and the measuring force are identical according to test specifications, the Soviet micrometers are obviously too heavy. Many tons of high-quality steel could be saved annually by reducing the weight of the Soviet micrometers to the necessary amount.

SNAROVSEIY, Ye S:

At the Dnepropetrovsk Mining Institute in Artem Sergeyev from April 1939 to April 1947, the following dissertations were defended in connection with attaining the scholarly degree of Candidate of Technical Sciences (specializing in mining electrical engineering: Ye S. Snarovskiy on 27 April 1939 defended his dissertation on the subject "An investigation of electric asynchronous drive with a stator in the form of an arc for use in mining machinery".

The official opponents of this dissertation were the late Doctor of Technical Sciences Professor V. B. Umanskiy and Candidate of Technical Sciences Docent V. S. Rakita.

The theoretical investigation was presented of the magnetic field at the edges of a stator proposed by Engineer P. A. Fridkin. The conclusions drawn were confirmed experimentally on a model of an arc stator. Technical calculations were made showing the value of using this type of drive for mining purposes.

AUTHOR: Snagovskiy, Ye. S.

TITLE: The Basic Demands for Telemechanical Arrangements in
Coal Mines (Osnovnyye trebovaniya k telemekhanicheskim
ustroystvam na ugol'nykh shakhtakh)

PERIODICAL: V sb: Telemekhaniz. v nar. kh-ve. Moscow, AN SSSR,
1956, pp 391-402

ABSTRACT: The author examines the problem of the complex applica-
tion of technical means for dispatching and supplement-
ing, by telephone connections, the telemechanical
arrangements for automatic control and accounting. The
objects needing telemechanization are enumerated, and
are sorted according to their areal distribution on the
surface of the mine, in the near-shaft dump yards, and
in sections of the mine. For each of these locations
plans of telemechanization are proposed for mines with
various methods of operation. It is shown that tele-

Card 1/2

15-57-3-3866

The Basic Demands for Telemechanical (Cont.)

mechanical arrangements for mine operations should be designed in separate parts, so that the dismantling and assembling of any part would not keep the whole system idle long. The author considers it important to establish control over the transport of the coal and recommends for this purpose an arrangement for counting cars and for determining the quantity of coal supplied by the conveyer. He shows that the surface operator must be able to exercise the control indicated and, in addition, to effect distant direction of the mechanism for loading and transportation of the coal, of the principal ventilation blowers, and of a number of other processes, which the author describes. Examining the requirements for lines of connection and for apparatus, the author notes that the telemechanical arrangements should not call for essential repairs of established mining equipment, hamper the productive processes, or disturb the technology. Their usefulness should be considered in places where the air is extra moist or dusty. The telemechanical apparatus should consist of separate circuits for maximum simplicity in restoring normal operations after shutdowns, and to facilitate dismantling and transfer of equipment.
